Both of these ideas, with minor changes, are the basis for most modern gas turbines in use today. Marine Gas Turbine Engine Using a GTE to propel a ship goes back to 1937 when a Pescara free piston gas engine was used experimentally with a GTE. The free piston engine, or gasifier (fig. 1-5), is a form of diesel engine.

The output of the turbine is a function of the initial steam conditions, the turbine exhaust pressure, and the process steam demand. The power production of this unit type is limited by the process demand, unless an artificial demand is created by the use of a steam vent at the exhaust.

Turbines used in thermal powerplants :-Also called as steam turbines, they are used in nuclear & thermal powerplants where water is heated to form steam & then flowed through turbines to produce electricity. Alike water turbines, steam turbines are also classified into impulse & reaction types but the arrangement & design is different.

MODEL STEAM TURBINES Steam turbines have come very much to the fore during recent years, especially for marine propulsion. In principle they are far simpler than cylinder engines, steam being merely directed at a suitable angle on to specially shaped vanes attached to a revolving drum and shaft. In the Parsons type of turbine the

Steam Turbine. In general, a steam turbine is a rotary heat engine that converts thermal energy contained in the steam to mechanical energy or to electrical energy. In its simplest form, a steam turbine consists of a boiler (steam generator), turbine, condenser, feed pump and a variety of auxiliary devices. Unlike with reciprocating engines, for instance, compression, heating and expansion are ...

The turbines used in a hydroelectric plant look completely different from a steam turbine because water is so

much denser (and slower moving) than steam, but it is the same principle. Wind turbines, also known as wind mills, use the wind as their motive force.

Gas Turbine Working Principles. Gas turbine engines derive their power from burning fuel in a combustion chamber and using the fast moving combustion gases to drive a turbine in much the same way as the high pressure steam drives a steam turbine. A simple gas turbine is comprised of three main sections a compressor, a combustor, and a power turbine.

With reciprocating steam engines, the air entering is about 15 kg per 10,000 kg of steam. In case of jet condensers the amount of air dissolved in injection water is about 0-5 kg per 10,000 kg of water. The important effects of presence of air in the condenser are as follows : ...

Siemens offers a comprehensive range of steam turbines from 45kW to 1,200MW, with the flexibility to address the specific requirements for your application. For our range of predesigned steam turbines with a power out- put from 45kW up to 12MW and for large steam turbines from 250MW to 1,200MW, we offer separate portfolio brochures.
