1. Introduction. Initially, the growing attention on Reverse Logistics (RL) and Closed-Loop Supply Chain (CLSC) issues originated with public awareness (discussed in Dowlatshahi, 2000). Then governmental legislation forced producers to take care of their End of Life (EOL) products.

k-means clustering is a method of vector quantization, originally from signal processing, that is popular for cluster analysis in data mining. k-means clustering aims to partition n observations into k clusters in which each observation belongs to the cluster with the nearest mean, serving as a prototype of the cluster. This results in a partitioning of the data space into Voronoi cells.

A review of Predictive health monitoring for rolling bearings is provided. A review of fault modelling for rolling bearings is provided. A discussion of wear evolution, surface topology evolution and their influences on the predictive health monitoring process is illustrated.

### **A summary of fault modelling and predictive health**

Control theory in control systems engineering is a subfield of mathematics that deals with the control of continuously operating dynamical systems in engineered processes and machines. The objective is to develop a control model for controlling such systems using a control action in an optimum manner without delay or overshoot and ensuring control stability.

**Gaussian Processes and Kernel Methods** Gaussian processes are non-parametric distributions useful for doing Bayesian inference and learning on unknown functions. They can be used for non-linear regression, time-series modelling, classification, and many other problems.
