A phase change material (PCM) is a substance with a high heat of fusion which, melting and solidifying at a certain temperature, is capable of storing and releasing large amounts of energy. Heat is absorbed or released when the material changes from solid to liquid and vice versa; thus, PCMs are classified as latent heat storage (LHS) units.

Technical Background. My goal is to maximizing taste and minimizing the risk from food pathogens. While pathogenic microorganisms can be controlled with acids, salts, and some spices, sous vide cooking relies

heavily on temperature control (Rybka-Rodgers, 2001).

Superhydrophilic Nano-Structured Coatings (SHNC) were discovered during pool boiling experiments using nanofluids with alumina nanoparticles. During nucleate boiling, the nanoparticles are deposited on the heater surface, forming a uniform oxide coating.

1. Introduction. Recently a significant progress has been achieved in the study of P<sup>3</sup>V<sup>3</sup>T properties of minerals and other materials in relation to the Earth and planetary mantle and core (Bassett, 2009, Hemley and Percy, 2010, Dubrovinsky et al., 2015).The major experimental techniques are diamond anvil cells and multianvil apparatus.
